Power-Monitor Installation & Setup

Installation

Installation is provided by our professional service team.

It comprise out of two stages

- 1) Installing BI-Server that include JBOSS, Pentaho BI , My SQL and Dedicated Java j2ee applications. All infrastructure is based on highly distinguished open source product with clients such as NASA ,SUN U.N and many more other.
- 2) Installing services running on each machine , each service contain its own JVM and report back to the main server either directly or via relay agents.

Setup

Setup is comprised out of 3 stages. In each stage we adapt the system to the organization type and requirements.

Stage1: Analysis

We check the network architecture , installation base and Level of save desired , Together with the client we define a proper policy.

Stage 2: Server Side

Setting up The BI-server with reports that reflect the energy saving policy . The server is located in reachable address where most machine can access it directly , for the rest we use relay agents

Stage 3: Client Side

Installing the Client side with monitoring service that send once in a while a notification to the server .each service is define during installation with tags that relate the machine to department ,activity etc'.

System

Requirements

Server (minimum requirement)

- Pentium CPU
- 1 GB
- 2GB space on Hard disk
- Windows XP / Vista/ 2000 / server 2003

Client side

- 70 MB Free space on HD (including it's own java VM)
- Windows XP / Linux / server 2003/2000 / NT / Vista

Relay Agents

- 70 MB Free space on HD (including it's own java VM)
- Windows XP / Linux / server 2003/2000 / NT / Vista
